

Bobcat Bites – Project Transfer Doc

Paste this whole doc into a new chat to bring it up to speed. Written 2026-07-11.

What this is

An order-ahead pickup app for UC Merced students to order from campus food trucks. Student orders and pays in-app, the truck gets notified, confirms and sets a prep-time ETA, student gets a live countdown and picks up when it's ready. Working name: ****Bobcat Bites****.

Where things stand

Backend, one vendor pitch deck, one vendor pitch doc, an onboarding flow spec, and a working mobile vendor web app all already exist. Nothing has been deployed to a public URL yet, and there's no student-facing app yet – only the vendor side.

Assets already created (in the outputs folder from this session)

- `UC\_Merced\_Vendor\_Pitch.docx` – one-pager pitch + cold outreach email template for recruiting trucks
- `UC\_Merced\_Vendor\_Onboarding\_Flow\_Spec.docx` – sign-up flow, daily operating flow, order status table, ETA logic, v1 build scope
- `Bobcat\_Bites\_Vendor\_Pitch\_Deck.pptx` – 6-slide pitch deck (problem, how it works, benefits, requirements, launch offer/CTA)
- `vendor\_app.html` – a single self-contained mobile web app for truck owners. Lets them sign up, edit truck info, toggle open/paused, build a menu, and manage the live order queue (confirm with ETA, mark ready, mark picked up). Talks directly to Supabase. Not yet hosted anywhere – needs to be dragged into something like app.netlify.com/drop for a shareable link, or deployed properly later.

Backend (Supabase) – already live

- Org: ****Velox**** (org id `yrxdbcptiqnepxdwcymh`)
- Project: ****questlurv's Project**** (id `gqwihtfjmxqkzssnsrk`, region us-east-2)
- URL: `https://gqwihtfjmxqkzssnsrk.supabase.co`
- Publishable key: `sb\_publishable\_3H-dZcAz2r7pDnGmxMJh1w\_efPN7ZVd`
- Tables (all with row-level security enabled): `vendors`, `vendor\_schedules`, `menu\_items`, `students`, `orders`, `order\_items`, `order\_status\_events`
- Order status lifecycle: `placed → confirmed → ready → picked\_up` (or `cancelled`)
- RLS policies: vendors only see/edit their own truck, menu, and orders; students only see their own orders; public can browse approved vendors and their available menu items

Connected tools relevant to this project

Connected and usable: Supabase (backend, used above), Gmail, Google Calendar, Google Drive, Notion, Slack, Zapier, Canva.

Installed but need the user to authorize (blocked in a non-interactive session, needs sign-in via claude.ai connector settings or `/mcp`):
GitHub (for code hosting/version control), **Stripe** (for vendor payouts – the schema already has `payout\_account\_id` on vendors and `payment\_intent\_id` on orders ready for it), **Figma** (for UI design).

Netlify CLI is available as a skill but needs an interactive browser login that couldn't be completed in this session – that's why the vendor app isn't hosted at a public URL yet.

Open decisions / things the user said

- Budget-constrained – explicitly said no capital for hardware (e.g. can't buy/loan tablets to vendors), which is why we pivoted from "lend a tablet" to "mobile web app vendors open on their own phone."
- User mentioned an "Angry Bird" chicken food truck they believe serves UC Merced – could not confirm this in web search. Closest name matches found: **Angry Chickz** (Fresno/Bakersfield-based, no confirmed Merced stop) and **Angry Byrd Hot Chicken** (appears Nashville-based). Needs direct confirmation from the user or a call to the truck.
- Other Merced-area food truck names surfaced via web search (not yet contacted): Tacos Rodriguez, La Taquerita, Marco's Tacos, Asian Style Kitchen, Kapwa Eats, Saechao, Taquizas Gracian, Tacos Y Mariscos Sinaloa, Punjabi Kitchen. UC Merced's own "Fork in the Road" dining program already rotates outside trucks through Scholars Lane – worth pitching the dining office directly as a fast path onto campus.
- No admin approval screen exists yet – vendors who sign up in the app currently sit in `pending` status with nothing to flip them to `approved` except manual DB edits.

Suggested next steps (not yet started)

1. Host `vendor\_app.html` at a real URL (Netlify Drop is the zero-cost/zero-signup option; a proper Netlify account + custom domain is the longer-term move).
2. Build a simple admin view to approve/reject vendor sign-ups.
3. Build the student-facing ordering app (browse trucks/menus, place + pay for an order, see live ETA).
4. Authorize Stripe to actually process payments and vendor payouts.
5. Confirm the real name/contact for the "Angry Bird" truck and finalize the outreach target list.
6. Send outreach (pitch doc + deck) to the target truck list.
